

A QUICK GUIDE FOR YOUR CALL WITH REMM

Remm's OpenClaw Personal OS

What you built, how it works, and how Remm gets from zero to a verified personal AI system.

SPEAK

ORGANIZE

REMEMBER

BUILD

One voice, one private doorway, one memory

The system turns natural speech and meetings into reviewed tasks, calendar events, and durable knowledge.

Explain it in one minute

Use this language first. Details can wait until Remm understands the outcome.

" You speak normally. OpenClaw and Codex organize the request. Obsidian remembers it. Granola captures the meeting. You stay in control of what becomes real.

Speak

Wispr Flow makes Telegram feel conversational.

Organize

Tasks, reminders, recurring work, and events land in the right place.

Remember

Notes and meetings become searchable personal context.

Build

Codex can create projects through GitHub and Vercel.

Show what it can do

Read these examples aloud. They make the system concrete without explaining technical details.

● Remind me every Wednesday at nine to prepare the weekly update.

● Add a task to send Sarah the proposal by Friday.

● Put lunch with Alex on my calendar next Tuesday at one.

● What did we decide in my last marketing meeting?

● What do I still owe people across my notes and meetings?

● Build a simple project tracker and publish it for me.

Meetings become reviewed follow through

Granola captures the conversation. Codex proposes the actions. Remm decides what becomes a task.

The trust rule

A transcript can contain guesses, tentative ideas, and work assigned to someone else. That is why meeting actions stay proposed until Remm explicitly approves them.

One daily command center

Each morning, one Obsidian note brings the day together.

Friday, August 1

Your day, assembled automatically

TOP PRIORITIES

- ☐ Prepare weekly update
- ☐ Send Sarah the proposal

CALENDAR

- ☐ 10:00 Team planning
- ☐ 1:00 Lunch with Alex

MEETING FOLLOW THROUGH

- ☐ Review two proposed Granola actions

Tasks

Today, overdue, recurring, and approved meeting actions appear together.

Events

Personal and work calendar context appears beside the work.

Notes

Remm can write freely without losing the structure around the day.

Private by default

The setup is useful because it has clear boundaries, not unlimited control of the Mac.

- Telegram accepts Remm's numeric user ID only.
- Groups are disabled initially.
- Tokens and secrets live in Doppler, never GitHub.
- Supported high risk actions require a short lived PIN.
- Meeting actions require review before task creation.
- Remm uses his own Google, GitHub, and Vercel accounts.

Do not connect his system using your accounts or tokens.

The template is shared. The identity, data, and deployments belong to Remm.

What Remm needs before setup

The overview works today. Save this checklist for the installation session.

Mac

A personal MacBook, charger, internet connection, administrator password, and 60 to 90 minutes.

Phone

An iPhone with Telegram and access to the email accounts used for sign in confirmations.

Accounts

Paid ChatGPT, personal Google, work Google, and the ability to create the remaining accounts.

Accounts used during setup

- ChatGPT with Codex
- GitHub
- Vercel
- Doppler
- Telegram
- Google
- Granola
- Wispr Flow
- Obsidian Sync

Start with one Codex prompt

Codex performs the safe technical work and pauses when Remm must personally participate.

1. Install Codex

Install the Codex desktop app and sign in using Remm's paid ChatGPT account.

2. Share the repository

Give Codex the public repository link and ask it to clone the project locally.

3. Paste the prompt

Use the master prompt from the guide. Codex reads the files before installing anything.

COPY INTO CODEX

Set up my OpenClaw Personal OS using <https://github.com/CraftYourDesires/openclaw-personal-os>. Read README.md, DECISIONS.md, setup.sh, and guide/index.html first. Walk me through one step at a time. Perform safe setup work yourself. Pause only when I must sign in, approve permission, create a private token, choose a plan, or make a meaningful decision. Use my own accounts, store secrets through Doppler, preserve existing files, and continue until every required doctor check and controlled test passes.

Remm handles the personal sign ins

Codex installs and verifies the technical pieces. Remm owns the identity and permission steps.

1

Codex

Sign in with paid ChatGPT

2

GitHub + Vercel

Create and own project accounts

3

Doppler

Create the private secrets project

4

Telegram

Create a bot with BotFather

5

Wispr Flow

Allow microphone and accessibility

6

Obsidian

Connect the personal Sync vault

7

Google

Authorize personal and work calendars

8

Granola

Sign in and permit meeting capture

Remm should never paste private tokens into GitHub, source files, or documentation.

Done means proven

The installation is complete only when the full loop works with Remm's own accounts.

Voice

Wispr dictation reaches the private Telegram bot.

Recurring task

A Wednesday request creates the correct schedule.

Calendar

An event appears in the intended Google calendar.

Daily note

Tasks and events appear in today's Obsidian note.

Granola

A real transcript reaches the meeting review packet.

Approval

Only selected meeting actions become tasks.

Recall

A question returns evidence from real notes.

Build

GitHub and Vercel publish the sample status page.

For today's call, the overview is enough.

Send the guide and repository afterward, then schedule the installation session.
